Problem

Find the difference between the total number of **CITY** entries in the table and the number of distinct **CITY** entries in the table.

The **STATION** table is described as follows:

STATION

Field	Type
ID	NUMBER
CITY	VARCHAR2(21)
STATE	VARCHAR2(2)
LAT_N	NUMBER
LONG_W	NUMBER

where **LAT_N** is the northern latitude and **LONG_W** is the western longitude.

For example, if there are three records in the table with **CITY** values 'New York', 'New York', 'Bengalaru', there are 2 different city names: 'New York' and 'Bengalaru'. The query returns **1**, because

total number of records − number of unique city names = .

Current Buffer (saved locally, editable)

MySQL

```
1  SELECT COUNT(CITY) - COUNT(DISTINCT CITY) FROM STATION;
```

Line: 1 Col: 41
